

Human Work in the Age of Smart Machines: The Future of Work and How to Thrive in It

In this groundbreaking book, economists Erik Brynjolfsson and Andrew McAfee argue that the rise of smart machines is not a threat to jobs but rather an opportunity for a new era of prosperity. They show how smart machines can help us work smarter, not harder, and how we can use our uniquely human abilities to create new value in a world where machines can do most of the routine work.

Brynjolfsson and McAfee provide a comprehensive overview of the latest advances in artificial intelligence and robotics, and they explain how these technologies are already transforming the workplace. They show how smart machines are being used to automate tasks that were once thought to be impossible, such as driving cars, diagnosing diseases, and writing legal briefs. They also discuss the ethical implications of smart machines, and they offer ways to ensure that these technologies are used for good.
